HOW TO CREATE AND PERPETUATE HEAD-NECK DYSFUNCTIONS:

DONALD G. SMITH, D.D.S. 299 ALHAMBRA CIRCLE CORAL GABLES, FLA. 33134

AGGRESSIVELY ATTEMPT TO OBTAIN "CENTRIC" BEFORE ESTABLISHING:

(1) satisfactory vertical dimension (2) unrestricted envelope of function (3) vertical only loading of posterior teeth.

EQUILIBRATE WITHOUT FIRST FILLING IN LOW FOSSAE

UNDERFILL THE POSTERIOR TEETH CAUSING:

- Loss of centric stop in center of tooth
- New centric stop is lateral interference after eruption and migration
- · Introduction of clamping vs. natural equilibration by grinding
- Closure of vertical dimension intrusion of posteriors by clenching too noxious to brux resulting in:
 - Increased overbite
 - Mandibular retrusion by: (1) neuro muscular avoidance or (2) mechanical wedging.

OVERCONTOUR LINGUAL SURFACES OF UPPER ANTERIORS CAUSING:

Retrusion of mandible to avoid noxious contact

ESTABLISH WORKING SIDE CONTACTS resulting in:

- Masseter stimulation and bruxing
- Muscular avoidance to opposite side
- Posterior bone loss and/or tooth sensitivity

OVERCONTOUR THE LOWER BUCCAL/UPPER LINGUAL CUSPS - places root forces outside vertical axis causing tipping forces = compression and tension in periodontium

PLACE CENTRIC CONTACTS so that vertical axis of tooth is not straddled.

ORTHODONTIC OVER RETRUSION OF ANTERIOR TEETH

Retrusion of anteriors into envelope of function

Creation of laterally or distally locked occlusion

ACCEPT AN ORTHODONTIC OR RESTORATIVE RESULT with lower buccal cusps in distal fossae of upper teeth. Upper transverse ridges are immediate distallizing interferences - restrictive to protrusive freedom - requires great care in fine tuning the occlusion to prevent distal avoidance of mandible

CLOSE THE VERTICAL DIMENSION

By equilibration without fossa build-up in order to maintain vertical dimension - (many lateral interferences are also centric stops)

ENCROACH INTO THE TONGUE SPACE with fat teeth or bulky appliances

Tongue retrusion = Mandibular retrusion = Cervical hyperextension, etc.

STEEPEN tooth anatomy with each new restoration - causing all of above to accumulate with time.
